

Hi,
New updates and instructions for running the project.

The zip will consist of **WEB part code** and its **Database**.

Web part folder name : Wedme

Database Name : 'wedme' [Name should me this]

Server used is : wamp [run using wamp server only if not working on other servers]

1. Extract the 'wedme.zip' and paste it on server location (www folder)
2. Database name should be wedme , If different name, Create new database
3. Import the database file named as 'wedme_mar30.sql' in db folder into 'wedme' database
4. Run project

> Please populate table with sufficient data so that it can show on options like Send Interest, My Profile etc.
